

SUMMER HOMEWORK

SCIENCE

YEAR 10 INTO YEAR 11 SUMMER TRANSITION WORK

OCR GATEWAY SCIENCE A

STUDENT INSTRUCTIONS

1. Complete all Biology, Chemistry and Physics revision maps.
2. Complete the 100 MCQ Challenge for Biology, Chemistry and Physics.
3. Mark your answers and correct any mistakes in a different colour.
4. Use your Year 10 notes and class resources to revisit any weak topics.
5. Bring all completed work to your first Science lesson in September.

Name: _____

Class: _____

B1.1 – Cell Structures – Revision Sheet

Subcellular structures

Label with the following cells diagrams using the appropriate name from this list:

nucleus plasmids cell membrane
slime capsule ribosomes flagella
mitochondria cell wall pili cytoplasm
vacuole chloroplasts genetic material

The light microscope
Label the light microscope, using the following:

What is the correct way to focus a light microscope on a new slide?

- Start with the highest magnification objective lens and move the stage away from it.
- Start with the highest magnification objective lens and move the stage towards it.
- Start with the lowest magnification objective lens and move the stage away from it.
- Start with the lowest magnification objective lens and move the stage towards it.

Cells structures

There are two main types of cells:

Eukaryotic cells contain genetic material in a _____ cells. Their size is between _____ and _____.

Prokaryotic cells do not contain a _____. Their genetic material floats in the _____. These are simple cells, an example of a Prokaryotic cell is a _____. Their size is between _____ and _____.

Image size

Below is a drawing of a mitochondria seen with an electron microscope. Calculate the actual length of the organelle as shown along the line A-B. Write your answer to the nearest micrometer (µm).

Image size = Actual size x Magnification
(mm) (mm)

Magnification

Write down the formula used to calculate magnification.

Total Magnification =

=

x

Wymondham High Academy

Comparing microscopes

What are the advantages and disadvantages of using a light and electron microscope?

Light Microscope	Electron microscope
Advantages	Advantages
Disadvantages	Disadvantages

Staining cells

Many cells are colourless. We stain cells to make them easier to observe.

Methylene Blue – used to see the nucleus of an _____ cell.

Iodine – used to see the nucleus of a _____ cell.

Crystal Violet – used to stain _____ of bacterial cells.

Cell components and their function

Match the cell components to their function

Mitochondria	Where photosynthesis takes place
Cell wall	Where protein synthesis takes place
Cell membrane	Where respiration takes place
Ribosomes	Controls which substance can move into and out of the cell
chloroplasts	Surrounds the cell, providing support

_____ cell

_____ cell

_____ cell

B1.3 – Respiration – Revision Sheet

Carbohydrates, Proteins and Lipids

Carbohydrate	Used for growth and repair
Lipids	Required by the body to maintain good health
Proteins	Used as a store of energy, and for insulation
Vitamins and minerals	Provide the body with energy

State the enzyme that digests each of the following and the product of the process.

- Carbohydrates _____
- Proteins _____
- Lipids _____

Aerobic Respiration

Complete the word equation and the balanced symbol equation for aerobic respiration:

Where in cells does the process of respiration take place _____

Limewater goes cloudy when carbon dioxide is added to it. After 10 minutes the limewater in flask B was cloudy, but the limewater in flask A remained colourless. Can you explain why?

Anaerobic Respiration

When there is not enough oxygen for aerobic respiration to take place the body transfers energy from its chemical store of glucose for short periods by anaerobic respiration. Complete the reaction:

An athlete is training for a marathon. When she runs, her heart beats faster than it does when she is resting. When she is running, their muscle activity increases. To do this, her muscle cells _____

at a faster rate to give her more energy. Her muscles need to be supplied with _____

and _____ more quickly.

Her heart beats faster to increase the flow of _____ which carries the products

away from her muscles. When you have finished exercising you keep breathing heavily. The extra oxygen you breathe in reacts with the lactic acid, breaking it down. The oxygen needed for this process is called the

Complete the equation for anaerobic respiration in yeast cells (and other microorganisms),

Anaerobic respiration in yeast is called fermentation. Give one use of fermentation in the food industry.

ATP

What is the name of the chemical reaction in animal's bodies that produces the most ATP?

In which organelle in a cell does the above reaction happen?

What three functions is ATP used for in animals?

- _____
- _____
- _____

Which row in the following table gives the correct comparison between aerobic and anaerobic respiration in animals? Circle the correct letter, A, B, C or D.

	Aerobic respiration	Anaerobic respiration
A	Produces more ATP	Produces less ATP
B	Produces lactic acid	Does not produce lactic acid
C	Does not use oxygen	Uses oxygen
D	Produces carbon dioxide	Produces carbon dioxide

Food Tests

Match the food molecule to the chemical used to test for its presence to the enzyme that breaks it down.

Food molecule	Chemical test	Enzyme
Starch	Iodine	Lipase
Sugar	Biuret	Protease
Protein	Ethanol	Amylase (a carbohydrase)
Lipids	Benedict's	Carbohydrase

B1.4 – Photosynthesis – Revision Sheet

Factors affecting photosynthesis

Circle the graph which correctly shows the effect of increasing the temperature on the rate of photosynthesis.

Bristlecone pine trees are among the longest living things on Earth. One of them, called Methuselah, is in California and is over 4,800 years old. Bristlecone pine trees live high up in the mountains.

The Temperature, dry soils and strong winds make them grow very slowly.

Explain why these extreme conditions make the bristlecone pine tree grow very slowly. [6 marks]

Tick the following statements to show which one is correct.

Plants photosynthesise only when it is light. ☐

Plants respire only when it is light. ☐

Plants respire only when it is dark. ☐

Plants photosynthesise only when it is dark. ☐

Photosynthesis experiments

Number the following steps in order to show how you would carry out an experiment to prove light is necessary for photosynthesis. What does this experiment test for? _____

1. Cover part of a leaf with card.
2. Wash the leaf.
3. Remove card from leaf, and leaf from plant.
4. Boil the leaf in ethanol.

Which kind of leaf would you use in the above experiment to show that chlorophyll is needed for photosynthesis? _____

Draw a diagram below to show the apparatus you could use to prove oxygen is given off during photosynthesis.

If I set up this experiment, what will the soda lime do? _____

If I test one of the leaves the following day, as described above, what will the iodine show? _____

Photosynthesis

Complete the word equation and the balanced symbol equation for photosynthesis:

What are the two main stages of photosynthesis? Which is light dependant, which is light independent.

Stage No	Light dependant or independent	Actions
1		Carbon dioxide gas combines with the hydrogen ion to make glucose
2		Energy transferred from light splits water molecules into oxygen gas and hydrogen gas

How does the carbon dioxide used in photosynthesis enter a plant? _____

How does the water used in photosynthesis enter a plant? _____

Limiting factors

Explain how you could use the following equipment to investigate how light intensity limits the rate of photosynthesis.

Explain why commercial growers increase the carbon dioxide concentration in a greenhouse.

Circle the letters on the graph to show where carbon dioxide is a limiting factor.

B1.1 – Cell Structures – Revision Sheet

Subcellular structures

Label with the following cells diagrams using the appropriate name from this list:

nucleus plasmids cell membrane
 slime capsule ribosomes flagella
 mitochondria cell wall pill cytoplasm
 vacuole chloroplasts genetic material

animal cell

plant cell

bacteria cell

The light microscope
 Label the light microscope, using the following:

What is the correct way to focus a light microscope on a new slide?

- Start with the highest magnification objective lens and move the stage away from it.
- Start with the highest magnification objective lens and move the stage towards it.
- Start with the lowest magnification objective lens and move the stage away from it.
- Start with the lowest magnification objective lens and move the stage towards it.

Cells structures

There are two main types of cells:

Eukaryotic cells contain genetic material in a **nucleus**. Example of a Eukaryotic cells are **plant** cells and **animal** cells. Their size is between **10µm** and **100µm**.
 Prokaryotic cells do not contain a **nucleus**. Their genetic material floats in the **cytoplasm**. These are simple cells, an example of a Prokaryotic cell is a **bacteria**. Their size is between **1µm** and **10µm**.

Image size

Below is a drawing of a mitochondria seen with an electron microscope. Calculate the **actual** length of the organelle as shown along the line A-B. Write your answer to the nearest micrometer (µm).

x 20 000

Image ÷ Magnification
 $67 \div 20\,000 = 0.00335$
 $0.00335 \times 1000 = 3.35\mu\text{m}$

Magnification

Write down the formula used to calculate magnification.

Total Magnification =

Eye piece lens

x

Objective lens

Comparing microscopes

What are the advantages and disadvantages of using a light and electron microscope?

Light Microscope	Electron microscope
Advantages	Advantages
Cheap, portable Simple to prepare slides Living or dead specimens Natural colour samples	Resolution to 0.1nm Maximum magnification about x100 000
Disadvantages	Disadvantages
Resolution to 0.2µm Maximum magnification x1500 (due to wavelength of light)	Expensive Difficult to move Complex to make slides Dead specimens only Black and white images only

Staining cells

Many cells are colourless. We stain cells to make them easier to observe.

Methylene Blue – used to see the nucleus of an **animal** cell.

Iodine – used to see the nucleus of a **plant** cell.

Crystal Violet – used to stain **cell wall** of bacterial cells.

Cell components and their function

Match the cell components to their function

Cell components	Where photosynthesis takes place
Mitochondria	Where protein synthesis takes place
Cell wall	Where respiration takes place
Cell membrane	Controls which substance can move into and out of the cell
Ribosomes	Surrounds the cell, providing support
chloroplasts	

Arrange the following structures in order of size

nucleus largest	gene	cell	chromosome	nucleotide smallest
--------------------	------	------	------------	------------------------

cell	nucleus	chromosome	gene	nucleotide
------	---------	------------	------	------------

Complete the following sentences using the words in the box.

DNA is made of two strands joined together by

nucleotides	helix	bases
-------------	-------	-------

bases. The strands are then twisted together to form a shape known as a double helix

DNA is made of lots of small units called **nucleotides**.

Each nucleotide is made of a sugar (deoxyribose), a phosphate group and a base.

Label the DNA nucleotide.

DNA is made up of four complimentary bases, known as

A adenine which bonds with T thymine

cytosine which bonds with G guanine

Complete the base sequence shown below:

B1.2 – What Happens in Cells? – Revision

Transcription and Translation

Match the following descriptions to the keyword.

Transcription	A copied DNA strand carrying genetic code out of the nucleus
Ribosome	To chemically make something new
Translation	Process by which an mRNA chain is made
mRNA	A subcellular structure where proteins are made
Synthesised	Process by which proteins are made

What order do these actions occur in transcription? Number them from 1 to 4

3	When the copy is complete the mRNA strand detaches and the DNA zips back together.
2	One DNA strand acts as a template, nucleotide bases of mRNA complimentary pair with the DNA to create a copy.
1	DNA unzips so both strands are separated.
4	The mRNA copy is small enough to leave the nucleus and enters a ribosome.

During protein synthesis the DNA that codes for a particular protein is copied. This copy is called mRNA. The diagram below shows the base sequence for a section of DNA.

GGTGGATT

What would be the complementary sequence of mRNA for this section of DNA? Tick your answer.

	C C A C G T A T A		G G T G C A T A T
X	C C A C G U A U A		G G U G C A U A U

What order do these actions occur in translation? Number them from 1 to 5.

- 1 The mRNA attaches to the ribosome in the cytoplasm.
- 2 The ribosome reads the order of the nucleotides in triplet codons on the mRNA.
- 3 Transfer RNA (tRNA) molecules bring the complimentary anticodon amino acid to the ribosome
- 4 The ribosome attaches the amino acid to the previous one to bind the chain together
- 5 The process is repeated along the whole mRNA chain until the complete protein is synthesised.

Insulin is a protein made of 51 amino acids. How many bases are in the length of DNA coding for insulin? Circle your answer.

DNA is a polymer. What is the name of the monomer in DNA? Circle your answer.

Base _____
Deoxyribose sugar

Enzymes and Enzyme Reactions

These are involved in many reactions in the body. They build **larger** molecules from small ones, such as protein synthesis.

They break down larger molecules into smaller one, as in digestion.

Label the enzyme, substrate and the active site.

Which substrate fits the enzyme? A

The graph shows the effect of temperature on an enzyme-catalysed reaction.

- a. State the optimum temperature for this enzyme.
- 37°C
- b. Describe how the rate of reaction varies with

c. Explain what happens at 50°C

Above 50°C the enzyme denatures, the active site changes shape, the substrate can no longer bind and reactions stop.

B1.3 – Respiration – Revision Sheet

Carbohydrates, Proteins and Lipids

Carbohydrate	Used for growth and repair
Lipids	Required by the body to maintain good health
Proteins	Used as a store of energy, and for insulation
Vitamins and minerals	Provide the body with energy

State the enzyme that digests each of the following and the product of the process.

- Carbohydrates Carbohydrase
- Proteins Protease
- Lipids Lipase

Aerobic Respiration

Complete the word equation and the balanced symbol equation for aerobic respiration:

Where in cells does the process of respiration take place Mitochondria

Lime water goes cloudy when carbon dioxide is added to it. After 10 minutes the lime water in flask B was cloudy, but the lime water in flask A remained colourless. Can you explain why? Flask B goes more cloudy because carbon dioxide is produced in aerobic respiration by the woodlice. Flask A doesn't change colour because air doesn't contain enough carbon dioxide to react with the lime water.

ATP

What is the name of the chemical reaction in animal's bodies that produces the most ATP?

Aerobic respiration

In which organelle in a cell does the above reaction happen?

Mitochondria

What three functions is ATP used for in animals?

- Enzymes – to make larger or smaller molecules
 - For movement - to contract muscle cells
 - To stay warm – respiration increases when the animal is cold
- Which row in the following table gives the correct comparison between aerobic and anaerobic respiration in animals? Circle the correct letter, A, B, C or D.

	Aerobic respiration	Anaerobic respiration
<u>A</u>	Produces more ATP	Produces less ATP
B	Produces lactic acid	Does not produce lactic acid
C	Does not use oxygen	Uses oxygen
D	Produces carbon dioxide	Produces carbon dioxide

Food Tests

Match the food molecule to the chemical used to test for its presence to the enzyme that breaks it down.

Food molecule	Chemical test	Enzyme
Starch	Iodine	Lipase
Sugar	Biuret	Protease
Protein	Ethanol	Amylase (a carbohydrase)
Lipids	Benedict's	Carbohydrase

Anaerobic Respiration

When there is not enough oxygen for aerobic respiration to take place the body transfers energy from its chemical store of glucose for short periods by anaerobic respiration. Complete the reaction:

Complete the sentences, using the words in the box.

blood breathe carbon dioxide glucose
heart nitrogen oxygen respire debt

An athlete is training for a marathon. When she runs, her heart beats faster than it does when she is resting. When she is running, their muscle actively increases. To do this, her muscle cells respire

at a faster rate to give her more energy. Her muscles need to be supplied with oxygen and glucose more quickly.

Her heart beats faster to increase the flow of blood which carries the products carbon dioxide and heat

away from her muscles. When you have finished exercising you keep breathing heavily. The extra oxygen you breathe in reacts with the lactic acid, breaking it down. The oxygen needed for this process is called the oxygen debt.

Complete the equation for anaerobic respiration in yeast cells (and other microorganisms).

Describe how you could use tube B to measure the rate of the reaction in the tube A? Count the number of bubbles or measure the volume of gas in a given time.

Anaerobic respiration in yeast is called fermentation. Give one use of fermentation in the food industry. Brewing beer, baking bread

Factors affecting photosynthesis

Circle the graph which correctly shows the effect of increasing the temperature on the rate of photosynthesis.

Bristlecone pine trees are among the longest living things on Earth. One of them, called Methuselah, is in California and is over 4,800 years old. Bristlecone pine trees live high up in the mountains.

The Temperature, dry soils and strong winds make them grow very slowly.

Explain why these extreme conditions make the bristlecone pine tree grow very slowly. [6 marks]

Photosynthesis is reduced because dry, windy conditions mean stomata are often closed, so reduced CO_2 taken in. Reduced rain means less water in the tree to transport minerals and less water available for photosynthesis. Colder temperatures reduce the rate of photosynthesis, and affect the ability of enzymes to work at their optimum

Tick the following statements to show which one is correct.

- Plants photosynthesise only when it is light. ☒
- Plants respire only when it is light. ☐
- Plants respire only when it is dark. ☐
- Plants photosynthesise only when it is dark. ☐

B1.4 – Photosynthesis – Revision Sheet

Photosynthesis experiments

Number the following steps in order to show how you would carry out an experiment to prove light is necessary for photosynthesis. What does this experiment test for? Starch

1. Cover part of a leaf with card.
2. Wash the leaf.
3. Add a few drops of iodine solution to the leaf.
4. Place the plant in the dark for 24 hours.
5. Remove card from leaf, and leaf from plant.
6. Place the plant in sunlight for a few hours.
7. Boil the leaf in ethanol.

Which kind of leaf would you use in the above experiment to show that chlorophyll is needed for photosynthesis? Variegated (stripey)

Draw a diagram below to show the apparatus you could use to prove oxygen is given off during photosynthesis.

Oxygen collected in the test tube

If I set up this experiment, what will the soda lime do? Removes the carbon dioxide from the air

If I test one of the leaves the following day, as described above, what will the iodine show? There has been no starch produced

Photosynthesis

Complete the word equation and the balanced symbol equation for photosynthesis:

What are the two main stages of photosynthesis? Which is light dependant, which is light independent.

Stage No	Light dependant or independent	Actions
2	Light independent	Carbon dioxide gas combines with the hydrogen ion to make glucose
1	Light dependant	Energy transferred from light splits water molecules into oxygen gas and hydrogen gas

How does the carbon dioxide used in photosynthesis enter a plant? Through the open stomata on the underside of the leaf

How does the water used in photosynthesis enter a plant? Through the root hair cells and then up through the xylem in the veins

Limiting factors

Explain how you could use the following equipment to investigate how light intensity limits the rate of photosynthesis.

Place the lamp close to the pondweed and count the number of bubbles released by the plant. Move the lamp at away from the weed in 10cm intervals counting the number of bubbles. Then plot a graph showing the distance of the light on the x axis and number of bubbles on the y axis.

Explain why commercial growers increases the carbon dioxide concentration in a greenhouse.

If you increase the concentration of the carbon dioxide the rate of photosynthesis will be increased. If photosynthesis increases you will increase the yield of the crop.

Circle the letters on the graph to show where carbon dioxide is a limiting factor.

Diffusion

Tick the box to answer the question.

True	False
Increasing the surface area decreases the rate of diffusion	
Particles move randomly	
Net movement of particles is from higher to lower concentration	
Increasing the temperature will increase the rate of diffusion	
The steeper the concentration gradient the slower the rate of diffusion	
Particles move up a concentration gradient	
The shorter the distance the particle have to move, the faster the rate of diffusion	

Name one example of where diffusion is occurring in humans and plants.

Humans: _____

Plants: _____

B2.1 – Supplying the Cell – Revision Sheet

Osmosis

Read the table right.

Which row describe osmosis?

A student investigated the effect of sugar solution concentration on pieces of potato.

This is the method used.

1. Cut three pieces of potato to the same length.
2. Dry each piece on a paper towel.
3. Weigh each piece.
4. Place potato in different concentration sugar solutions.
5. Leave all three pieces for 2 hours.
6. Remove the three pieces of potato from the solutions.
7. Dry each piece on a paper towel.
8. Measure the length and mass of each piece of potato.

Why did they dry each piece of potato before weighing?

The potato in tube B did not change, give one conclusion from this observation? _____

Requires energy	Movement down a concentration gradient	Substance(s) moved
A Yes	No	Water and glucose
B No	No	Water only
C Yes	Yes	Water and glucose
D no	Yes	Water only

What two changes would you expect in tube A after 2 hours? _____

Cell Differentiation

During the development of a multicellular organism, cells differentiate. What does this mean?

Match the specialised cell with the correct adaptation and function.

Cell	Adaptation	Function
Ciliated cell	Can expand	More room for haemoglobin molecules
Palisade cell	Contains many chloroplasts	photosynthesis
Sperm cell	Hair like structures on the surface	Sweep mucus away
Fat cell	Contains enzymes in acrosome	Fat storage
Red blood cell	No nucleus	Breaks down outer layer of ovum

Label the sperm cell adaptations and explain the reason for each one.

Active Transport

This paragraph is about moving substances by active transport. Complete the paragraph using the words from the box.

low mitochondria energy high respiration ATP

Active transport allows movement of substances from areas of _____ concentration to areas of _____ concentration.

It requires the breakdown of _____ to provide the _____ for active transport.

This is provided during cell _____. Cells that carry out lots of active transport will usually have many _____.

Name one example of where active transport is used in humans and plants.

Humans _____

Plants _____

Stem Cells

This paragraph is about stem cells in animals. Use the words from the box to complete the paragraph.

mitosis any adult repair undifferentiated differentiation

Stem cells in animals are _____. They can undergo the process of _____ to _____

become specialised to carry out a particular role. There are two main types of stem cell in animals; embryonic stem cells and _____ stem cells. Stem cells in mature animals are restricted in what type of cell they can become, embryonic stem cells can become _____ cell in the organism. Embryonic stem cells can divide through the process of _____ to make a whole organism.

Fully developed animals contain stem cells for their entire lives to help them _____ damaged tissues.

The figure left shows one area where stem cells can be found in a plant. What is this called? _____ Name one other location in a plant where stem cells can be found? _____

B2.2 – Challenges of Size – Revision Sheet

Exchange and Transport
Surface area and volume are important for the transport of substance in the circulatory system. Look at the diagram.

	1 mm cube	2 mm cube	4 mm cube
Surface area	6 sides x 1 mm ² = 6 mm ²	6 sides x 2 mm ² = 24 mm ²	6 sides x 4 mm ² = 96 mm ²
Volume	(1 mm) ³ = 1 mm ³	(2 mm) ³ = 8 mm ³	(4 mm) ³ = 64 mm ³
Surface area: volume ratio	6/1	3/1	

Complete the table above for the 4mm cube. Explain which blood vessel would you expect to have the largest surface area: volume ratio?

Circulatory System

The picture on the right shows three of the blood vessels found in humans (not drawn to scale).

What is the lumen? _____

Arteries carry blood away from the heart under high pressure.

On the diagram, left, select the correct vessel in each part of the circulatory system.

Capillary walls are one cell thick and are semipermeable enabling substances to pass through.

What types of blood vessels will be found inside the lungs? _____

Blood circulates through the human heart twice during each circuit of the body. It is called a _____ circulatory system.

Plant Transport Systems

The diagram, right, shows a cross-section of a plant root and the vascular bundle. Draw a line to match the correct name to the type of tissue shown.

In the circle on the right sketch where the vascular bundles are found in the stem of a plant.

Name two substances transported by xylem.

Name two substances transported by phloem.

Translocation is a process that occurs in plants. Which row in the table describe translocation?

Transport tissue	Substances transported	Direction of movement	Involves active transport
A	Phloem	Two way flow	Yes
B	Phloem	Unidirectional	No
C	Xylem	Unidirectional	No
D	Phloem	Sucrose	Two way flow

Factors Affecting Transpiration

Match the following factors to the explanations.

Factor	Description	Explanation
Light	Transpiration is faster in higher temperature	The stomata open wider to allow CO ₂ into the leaf for photosynthesis
Temperature	Transpiration is faster in windy conditions	Water vapour quickly removed by air movement, speeds up diffusion out of the leaf
Wind	In bright light transpiration increases	Evaporation and diffusion are faster at higher temperatures
Humidity	Transpiration is slower in humid conditions.	

Look at the diagram of the potometer.

How can the apparatus be changed to increase the rate of water uptake?

- A – Add more water to the beaker
- B – Switch on a fan next to the apparatus
- C – Place a plastic bag over the plant
- D – Remove two leaves

Heart and Blood

The picture below shows a human heart. Colour the side pumping deoxygenated blood blue. Colour the side pumping oxygenated blood red. Complete the labels.

The p _____ a _____ the a _____ takes blood to _____ the b _____

V _____ C _____ R _____ A _____ T _____ V _____ R _____ V _____ S _____

Transports food, waste and hormones

Helps blood to clot

Carries oxygen

Fight disease by making antibodies

You have 5 litres of blood in your body.

The blood is made of four parts. The descriptions shown in the table, left, list the main job of those four parts, what are they called?

B2.1 – Supplying the Cell – Revision Sheet

Diffusion

Tick the box to answer the question.

	True	False
Increasing the surface area decreases the rate of diffusion		✓
Particles move randomly	✓	
Net movement of particles is from higher to lower concentration	✓	
Increasing the temperature will increase the rate of diffusion	✓	
The steeper the concentration gradient the slower the rate of diffusion		✓
Particles move up a concentration gradient		✓
The shorter the distance the particle have to move, the faster the rate of diffusion	✓	

Name one example of where diffusion is occurring in humans and plants.

Humans: Oxygen diffuses into blood
Plants: CO₂ diffuses into leaf cells for photosynthesis

Osmosis

Read the table right. Which row describe osmosis?

	Requires energy	Movement down a concentration gradient	Substance(s) moved
A	Yes	No	Water and glucose
B	No	No	Water only
C	Yes	Yes	Water and glucose
D	no	Yes	Water only

A student investigated the effect of sugar solution concentration on pieces of potato.

This is the method used.

1. Cut three pieces of potato to the same length.
2. Dry each piece on a paper towel.
3. Weigh each piece.
4. Place potato in different concentration sugar solutions.
5. Leave all three pieces for 2 hours.
6. Remove the three pieces of potato from the solutions.
7. Dry each piece on a paper towel.
8. Measure the length and mass of each piece of potato.

Why did they dry each piece of potato before weighing?

To remove excess water/get mass of potato only

The potato in tube B did not change, give one conclusion from this observation? conc. of sugar in the cells is the same as the solution (0.4mol/dm³)

What two changes would you expect in tube A after 2 hours? Increase in size/length and mass

Active Transport

This paragraph is about moving substances by active transport. Complete the paragraph using the words from the box.

low	mitochondria	energy	high
	respiration	ATP	

Active transport allows movement of substances from areas of low concentration to areas of high concentration.

It requires the breakdown of ATP to provide the energy for active transport.

This is provided during cell respiration

Cells that carry out lots of active transport will usually have many mitochondria

Name one example of where active transport is used in humans and plants.

Humans: Small intestines/nerve cells
Plants: Root hair cells

Stem Cells

This paragraph is about stem cells in animals. Use the words from the box to complete the paragraph.

mitosis	any	adult	repair
undifferentiated		differentiation	

Stem cells in animals are undifferentiated. They can undergo the process of differentiation to become specialised to carry out a particular role. There are two main types of stem cell in animals; embryonic stem cells and adult stem cells. Stem cells in mature animals are restricted in what type of cell they can become,

embryonic stem cells can become any cell in the organism. Embryonic stem cells can divide through the process of mitosis to make a whole organism. Fully developed animals contain stem cells for their entire lives to help them repair damaged tissues.

The figure left shows one area where stem cells can be found in a plant. What is this called? meristem

Name one other location in a plant where stem cells can be found? Root tips, side shoots

Mitosis

Mitosis is the process by which body cells divide. Each cell divides to produce two daughter cells, which are genetically identical to each other.

A cell cycle has four stages shown in the numbered images on the left. Label the images using the following names.

DNA replication

DNA replication movement of chromosomes cytokinesis growth of daughter cells

Number the following sentences to describe the process of mitosis. The first one has been done for you:

- 1 A cell grows in size and mass and chromosomes are replicated
- 2 The cell membrane and cytoplasm divide
- 3 Chromosomes align across the centre of the cell
- 4 One copy of each chromosome moves to opposite ends of the cell
- 5 Nuclear membranes form
- 6 The nuclear membrane breaks down

Growth of daughter cells

cytokinesis

Cell Differentiation During the development of a multicellular organism, cells differentiate. What does this mean? The cell becomes specialised to be able to complete a particular role

Match the specialised cell with the correct adaptation and function.

Cell	Adaptation	Function
Ciliated cell	Can expand	More room for haemoglobin molecules
Palisade cell	Contains many chloroplasts	photosynthesis
Sperm cell	Hair like structures on the surface	Sweep mucus away
Fat cell	Contains enzymes in acrosome	Fat storage
Red blood cell	No nucleus	Breaks down outer layer of ovum

Label the sperm cell adaptations and explain the reason for each one. Lots of mitochondria – high level of energy transfer from chemical store to move tail

Acrosome – store of digestive enzymes to break down outer layer of ovum
Tail (flagellum) – propels the Nucleus towards the ovum

B2.2 – Challenges of Size – Revision Sheet

Plant Transport Systems

The diagram, right, shows a cross-section of a plant root and the vascular bundle. Draw a line to match the correct name to the type of tissue shown.

In the circle on the right sketch where the vascular bundles are found in the stem of a plant.

Name two substances transported by xylem.

1. Water 2. minerals

Name two substances transported by phloem.

1. Water 2. sugar

Translocation is a process that occurs in plants. Which row in the table describe translocation? A

Transport tissue	Substances transported	Direction of movement	Involves active transport
A	Phloem	Sucrose	Two way flow
B	Phloem	Mineral ions	One direction only
C	Xylem	Mineral ions	One direction only
D	Phloem	Sucrose	Two way flow

Exchange and Transport
Surface area and volume are important for the transport of substance in the circulatory system. Look at the diagram.

1 mm cube	2 mm cube	4 mm cube
Surface area 6 sides x 1 mm ² = 6 mm ²	6 sides x 2 mm ² = 24 mm ²	6 sides x 4 mm ² = 96 mm ²
Volume 1 mm ³	(2 mm) ³ = 8 mm ³	(4 mm) ³ = 64 mm ³
Surface area: volume ratio 6/1	3/1	1.5/1

Complete the table above for the 4mm cube. Explain which blood vessel would you expect to have the largest surface area: volume ratio?
Capillaries because the huge network gives a large SA:V ratio

Circulatory System

The picture on the right shows three of the blood vessels found in humans (not drawn to scale). What is the lumen? The hollow cavity in the centre

Arteries carry blood away from the heart under high pressure.

On the diagram, left, select the correct vessel in each part of the circulatory system.

Capillary walls are one cell thick and are semipermeable enabling substances to pass through.

What types of blood vessels will be found inside the lungs? capillaries

Blood circulates through the human heart twice during each circuit of the body. It is called a double circulatory system.

Transpiration Stream

Number the following sentences to describe the movement of water through a plant. The first one has been done for you.

- Water moves in the xylem up through the stem and into the leaves
- Water is lost from the leaves by evaporation through open stomata
- Water and minerals move from cell to cell through the root until they reach xylem vessels
- Water moved into the root from the soil by osmosis

The diagram shows a cross section through the lower layers of a leaf. What are A and B?

A Guard cell
B Stomata

Cell A can lose or gain water. Complete the sentences, choosing words from the box.

active transport
condensation
osmosis
photosynthesis
transpiration

Cell A can gain water by osmosis

Water vapour can escape from the leaf through hole B by transpiration

Factors Affecting Transpiration

Match the following factors to the explanations.

Factor	Description	Explanation
Light	Transpiration is faster in higher temperature	The stomata open wider to allowing CO ₂ into the leaf for photosynthesis
Temperature	Transpiration is faster in windy conditions	Water vapour quickly removed by air movement, speeds up diffusion out of the leaf
Wind	In bright light transpiration increases	Evaporation and diffusion are faster at higher temperatures
Humidity	Transpiration is slower in humid conditions.	

Look at the diagram of the potometer. How can the apparatus be changed to increase the rate of water uptake?

- Add more water to the beaker
- Switch on a fan next to the apparatus
- Place a plastic bag over the plant
- Remove two leaves

Heart and Blood

The picture below shows a human heart. Colour the side pumping deoxygenated blood blue. Colour the side pumping oxygenated blood red. Complete the labels.

Transports food, waste and hormones	Plasma
Helps blood to clot	Platelets
Carries oxygen	Red blood cell
Fight disease by making antibodies	White blood cell

B3 – Nervous System & Endocrine System – Revision Sheet

Negative Feedback

Negative feedback is an important type of control used in homeostasis. It allows the body to keep internal conditions constant.

Add numbers to the table below to show the correct order to describe how negative feedback works. One has been done for you.

	Corrective mechanisms switched off
	Change detected by receptor
1	Conditions in the body change from set point
	Conditions returned to set point
	Corrective mechanism activated by an effector

Two important hormones in the body controlled by negative feedback are thyroxine and adrenaline. What are the roles of these hormones in the body?

Thyroxine: _____

Adrenaline: _____

Suggest a situation that could trigger the release of adrenaline.

If adrenaline is released in the body what changes would be observed?

The hormone thyroxine helps to control the amount of energy available to cells. Complete the diagram to show how energy levels in the body are controlled.

Nervous System

What are the two parts of the body that make up the central nervous system?

_____ and _____

The nervous system sends nerve impulses around the body. Nerve impulses are _____ signals sent along neurones.

1. _____ neurones

3. _____ neurones

2. _____ neurones
What does the red arrow indicate in each neurone?

Sometimes motor neurones can be damaged. Look at the pictures on the left. How would the damage affect the transmission of impulses? Explain your answer.

Reflexes

What are the features of a reflex action? Select the correct answers:

Does not require conscious thought ☐

Usually protective ☐

Brain is always involved ☐

Response is involuntary ☐

Response is voluntary ☐

From the list below circle the reflex actions:

Heart beating

Coughing

Running

Thinking

Reading

Eating

Blinking

Sneezing

Add numbers to the table below to show the correct order of the pathway in a nervous reaction from stimulus (1) to response (9).

1	Stimulus
	Sensory neurone
	Receptor cells
	Effector
	Brain
	Spinal cord
	Motor neurone
	Spinal cord
9	Response

The nerve pathway the impulse follows is called a _____.

Hormones

This paragraph is about the endocrine system. Complete the paragraph using the words from the box once.

hormones pituitary hormones blood glands long-term nervous glands endocrine hormones

The _____ system consists of a number of _____ . These secrete _____

which are chemical messengers that affect the

coordination and control of our bodies. They travel in

the _____ throughout the body and have their

effect at target organs. Although some hormones can

act very quickly, most act more slowly than the effects of

the _____ system, and their effects are more

_____ . The _____ gland is the

master gland. Some of the hormones it produces can

directly affect the body. The pituitary gland also secretes

hormones that indirectly affect the body. They travel to

other _____ which in turn secrete their own

_____ to bring about specific effects.

On the diagram below, name the major glands of the endocrine system (Heart and lungs shown for position only).

Match the hormone to the gland that produces it. Some glands produce more than one hormone.

Hormone	Where is hormone produced?
Oestrogen	Adrenal glands
Insulin	Testes
Adrenaline	Ovary
Testosterone	Pancreas
Thyroxine	Thyroid gland
Progesterone	

Hormones are involved in an important process called homeostasis. What is homeostasis?

Which two of these processes are regulated by homeostasis?

Controlling water output in urine. ☐

Defending the body against pathogens. ☐

How quickly you walk. ☐

Keeping cool on a hot day. ☐

Waking up in the morning. ☐

B3 – Nervous System & Endocrine System – Biology Revision Sheet

Using Hormones to Treat Infertility

Being infertile means, someone cannot reproduce. Infertility can be caused by many reasons, some are problems with male reproductive organs and some female. List two causes of infertility for each:

Male 1: _____

2: _____

Female 1: _____

2: _____

Hormones can be given to women to treat some of these problems. Suggest two hormones which could be used to help someone become fertile and why?

_____ because _____

_____ because _____

Write an A for advantage or D for disadvantage next to the following statements about IVF.

- _____ It is an expensive procedure
- _____ It is often unsuccessful
- _____ Pregnancy is natural once a fertilised egg is implanted
- _____ It allows people to have children
- _____ It can result in multiple pregnancies

Menstrual Cycle
Label the diagram of the female reproductive system and its function.

Hormone concentration in the blood

What is the full name of FSH? _____

What is the full name of LH? _____

What is ovulation? _____

State the time period during which ovulation will occur _____

State how long the period lasts? _____

How long does it take for the uterus lining to reach maximum thickness? _____

Match the reproductive hormones with their correct functions

Hormone	Function of hormone
FSH	Triggers ovulation
LH	Maintains uterus and inhibits LH
Oestrogen	Causes lining of uterus to build up and inhibits FSH
Progesterone	Stimulates eggs to mature and ovaries to secrete oestrogen

Controlling Reproduction

There are two methods of contraception used to prevent pregnancy, hormonal and non-hormonal. Explain them:

Hormonal: _____

Non-hormonal: _____

Write the following forms of contraception in the correct box:

Condom	Hormonal	Non-hormonal
Diaphragm		
Intrauterine device (IUD)		
Intrauterine system (IUS)		
Combined pill		
Progestrone pill		

HIV is a virus that causes AIDS. HIV can be transmitted during unprotected sexual intercourse. Name one method of contraception that prevents the transmission of HIV and how?

Method	Pregnancies per 100 couples each year.
The pill	8
Condom	18
Diaphragm	16
IUD	1
Withdrawal	27

Using the data from the table, right, it shows the effectiveness of different types of contraception.

A. Withdrawal is the least effective method of birth control from the table, B. The condom is 10% more effective than the pill circle two correct C. A diaphragm gives a 16% chance of pregnancy each year. D. The IUD is 100% effective in birth control.

Controlling Blood Sugar

This paragraph explains how the body controls blood sugar levels. Complete the paragraph using the words from the box once.

Your cells need a constant supply of _____ for respiration. Too much or too little will cause serious problems. If the blood glucose level gets too high, cells in the _____ produce the hormone _____ which causes glucose to be converted into _____ for storage in the liver. If the blood glucose level gets too low, the hormone _____ is released by the _____ converting glycogen back into glucose. A balance is kept, this is an example of _____.

glucagon pancreas homeostasis glucose insulin glycogen pancreas

	Glycogen is stored in the liver	Add numbers to the table below to show the correct order for how the body normally responds to eating a sugary meal.
1	Glucose is converted to glycogen	
	Blood glucose concentration decreases	
	Blood glucose concentration increases	
	The pancreas releases insulin	
	The liver is stimulated	

Diabetes is a condition where the body can no longer control blood sugar normally. There are two types of diabetes, type 1 and type 2. Colour the boxes as follows to identify the statements.

How long after the meal is person B's insulin production at its peak?	Type 1 blue	Cells don't respond to insulin properly	Can't produce insulin	Normally begins in childhood
What is the greatest decrease in the blood sugar level of person B in an hour?	Type 2 green	Controlled by insulin injections	Obesity is a risk factor	Controlled by diet
Estimate how long after eating the meal will take for person B's blood sugar level to return to the level before the meal?				

Nervous System

What are the two parts of the body that make up the central nervous system?

brain and **spinal cord**

The nervous system sends nerve impulses around the body. Nerve impulses are **electrical** signals sent along neurones.

There are three types of neurones, they are shown in the diagrams below, name them correctly. Label the parts of each neurone.

Sometimes motor neurones can be damaged. Look at the pictures on the left. How would the damage affect the transmission of impulses? Explain your answer. **Transmission will be slower because myelin sheath is damaged**

B3 – Nervous System & Endocrine System – Biology Revision Sheet

Reflexes

What are the features of a reflex action? Select the correct answers:

- Does not require conscious thought ☒
- Usually protective ☒
- Brain is always involved ☐
- Response is involuntary ☒
- Response is voluntary ☐

From the list below circle the reflex actions:

- Heart beating**
- Coughing**
- Running
- Thinking
- Reading
- Eating
- Blinking
- Sneezing

Add numbers to the table below to show the correct order of the pathway in a nervous reaction from stimulus (1) to response (9).

1	Stimulus
3	Sensory neurone
2	Receptor cells
8	Effector
5	Brain
4/6	Spinal cord
7	Motor neurone
4/6	Spinal cord
9	Response

The nerve pathway the impulse follows is called a **Reflex arc**.

Negative Feedback

Negative feedback is an important type of control used in homeostasis. It allows the body to keep internal conditions constant.

Add numbers to the table below to show the correct order to describe how negative feedback works. One has been done for you.

5	Corrective mechanisms switched off
2	Change detected by receptor
1	Conditions in the body change from set point
4	Conditions returned to set point
3	Corrective mechanism activated by an effector

Two important hormones in the body controlled by negative feedback are thyroxine and adrenaline. What are the roles of these hormones in the body?

Thyroxine: **Regulates the body's metabolic rate**

Adrenaline: **Prepares the body in times of stress for the fight or flight reaction**

Suggest a situation that could trigger the release of adrenaline. **An exam, a scary film, rollercoaster**

If adrenaline is released in the body what changes would be observed? **Respire quicker to increase ATP production, breathing increases, heart rate rises, blood diverts towards muscles**

The hormone thyroxine helps to control the amount of energy available to cells. Complete the diagram to show how energy levels in the body are controlled.

Explain why controlling energy levels is an example of negative feedback.

High levels of thyroxine inhibit release of TSH. Low levels of TSH inhibits the release of thyroxine. Any change in energy levels is detected. Changes in thyroxine levels bring energy levels back to normal

Hormones

This paragraph is about the endocrine system. Complete the paragraph using the words from the box once.

hormones pituitary hormones blood glands long-term nervous glands endocrine hormones

The **endocrine** system consists of a number of **glands**. These secrete **hormones**

which are chemical messengers that affect the coordination and control of our bodies. They travel in the **blood** throughout the body and have their effect at target organs. Although some hormones can act very quickly, most act more slowly than the effects of the **nervous** system, and their effects are more **long-term**. The **pituitary** gland is the master gland. Some of the hormones it produces can directly affect the body. The pituitary gland also secretes hormones that indirectly affect the body. They travel to other **glands** which in turn secrete their own **hormones** to bring about specific effects.

On the diagram below, name the major glands of the endocrine system (Heart and lungs shown for position only).

In a different colour label the position and name the two glands that regulate the production of the hormones around the body.

Match the hormone to the gland that produces it. Some glands produce more than one hormone.

Hormone	Where is hormone produced?
Oestrogen	Adrenal glands
Insulin	Testes
Adrenaline	Ovary
Testosterone	Pancreas
Thyroxine	Thyroid gland
Progesterone	

Hormones are involved in an important process called homeostasis. What is homeostasis?

Keeping the conditions in your body constant

Which two of these processes are regulated by homeostasis?

- Controlling water output in urine. ☒
- Defending the body against pathogens. ☐
- How quickly you walk. ☐
- Keeping cool on a hot day. ☒
- Waking up in the morning. ☐

Menstrual Cycle

Label the diagram of the female reproductive system and its function.

Match the reproductive hormones with their correct functions

Hormone	Function of hormone
FSH	Triggers ovulation
LH	Maintains uterus and inhibits LH
Oestrogen	Causes lining of uterus to build up and inhibits FSH
Progesterone	Stimulates eggs to mature and ovaries to secrete oestrogen

B3 – Nervous System & Endocrine System – Biology Revision Sheet

The graph, below, shows the changes that occur to female hormone concentrations in the blood during the menstrual cycle.

What is the full name of FSH? **Follicle-stimulating hormone**

What is the full name of LH? **Luteinising hormone**

What is ovulation? **A mature egg is released from the ovary**

State the time period during which ovulation will occur **12-16 days**

State how long the period lasts? **5 days**

How long does it take for the uterus lining to reach maximum thickness? **7 days**

Using Hormones to Treat Infertility

Being infertile means, someone cannot reproduce. Infertility can be caused by many reasons; some are problems with male reproductive organs and some female. List two causes of infertility for each:

Male 1: **Blocked sperm ducts**

2: **Not enough sperm produced**

Female 1: **Lack of mature eggs**

2: **Ovaries don't release any eggs**

Hormones can be given to women to treat some of these problems. Suggest two hormones which could be used to help someone become fertile and why?

FSH because **matures the egg**

LH because **triggers ovulation**

Write an A for advantage or D for disadvantage next to the following statements about IVF.

D It is an expensive procedure

D It is often unsuccessful

A Pregnancy is natural once a fertilised egg is implanted

A It allows people to have children

D It can result in multiple pregnancies

Controlling Blood Sugar

This paragraph explains how the body controls blood sugar levels. Complete the paragraph using the words from the box once.

Your cells need a constant supply of **glucose** for respiration. Too much or too little will cause serious problems. If the blood glucose level gets too high, cells in the **pancreas** produce the hormone **insulin** which causes

glucose to be converted into **glycogen** for storage in the liver. If the blood glucose level gets too low, the hormone **glucagon** is released by the **pancreas** converting glycogen back into glucose. A balance is kept,

this is an example of **homeostasis**.

How long after the meal is person B's insulin production at its peak? **1 hour**

What is the greatest decrease in the blood sugar level of person B in an hour? **230 - 185 = 45mg/100cm³**

Estimate how long after eating the meal will take for person B's blood sugar level to return to the level before the meal? **4.5 (to 5) hours**

6	Glycogen is stored in the liver	Add numbers to the table below to show the correct order for how the body normally responds to eating a sugary meal.
3	Insulin travels in the blood	
5	Glucose is converted to glycogen	
7	Blood glucose concentration decreases	
1	Blood glucose concentration increases	
2	The pancreas releases insulin	
4	The liver is stimulated	

Diabetes is a condition where the body can no longer control blood sugar normally. There are two types of diabetes, type 1 and type 2. Colour the boxes as follows to identify the statements.

Type 1 blue	Cells don't respond to insulin properly	Can't produce insulin	Normally begins in childhood
Type 2 green	Controlled by insulin injections	Obesity is a risk factor	Controlled by diet
			Pancreatic cells destroyed

Controlling Reproduction

There are two methods of contraception used to prevent pregnancy, hormonal and non-hormonal. Explain them:

Hormonal: **Uses hormones to disrupt the normal female reproductive cycle**

Non-hormonal: **Barrier methods that stop the sperm and egg coming together, chemicals to kill sperm**

Write the following forms of contraception in the correct box:

Condom	Hormonal	Non-hormonal
Diaphragm		
Intrauterine device (IUD)		
Intrauterine system (IUS)		
Combined pill		
Progesterone pill		

HIV is a virus that causes AIDS. HIV can be transmitted during unprotected sexual intercourse. Name one method of contraception that prevents the transmission of HIV and how?

Condom – a barrier that stops transfer of fluids

Look at the table of data, right. It shows the effectiveness of different types of contraception.

Method	Pregnancies per 100 couples each year.
The pill	8
Condom	18
Diaphragm	16
IUD	1
Withdrawal	27

Using the data from the table, **A** Withdrawal is the least effective method of birth control circle two correct **C** The condom is 10% more effective than the pill **D** The IUD is 100% effective in birth control.

What is the equation to calculate speed?

What is the equation to calculate acceleration?

A bike travels 20km in 45 mins
what is it's speed in m/s?

A car is travelling at 60m/s,
and brakes to a speed of
14m/s, in 2.7seconds. What
is the deceleration?

What is kinetic energy? What is it
measured in?

What is the equation of motion that links initial
and final velocities, acceleration, and distance?

How far would a person go in
the 0.2 s travelling at 50 km/h

What is the equation for
kinetic energy?

What is the KE of a bird, mass 40g flying
at 23m/s?

If a ball is dropped from rest and falls 8m to the
ground, what is the speed just before it hits the
ground? (Take acceleration due to gravity to be
10m/s²)

Give an example of a contact force.

Give an example of a non-contact force.

Draw a free body diagram for a car moving forward with a force of 3000N and a drag force of 1000N.

What would the result force be and in which direction?

What is Work done?

What is power and what is it measured in?

What is Newton's 1st law?

What is the equation to calculate force, using Newton's 2nd law?

An aircraft accelerates from 20m/s to 60 m/s in 20 seconds. Calculate the acceleration

2.2 Newton's laws

What is Newton's 3rd law?

Explain how a rocket takes off using Newton's 3rd law.

What is the equation for work done?

What is the equation for power?

If an object has a 200 N force acting on it over a distance of 2 m, how much work is done?

If the work above is done in 4 seconds, what is the power?

What is terminal velocity?

How does air resistance affect speed?

(H) What is the equation for momentum?

(H) Calculate the momentum of a boy who's mass is 55 kg if he travels at a velocity of 6 m/s.

(H) A car of mass 1000kg heading up the M1 at 50m/s collides with a stationary truck of mass 8000kg and sticks to it. What velocity does the wreckage move forward at?

Explain using Forces how a parachute slows a skydiver down.

What is Hooke's law?

Why does an elastic band not obey Hooke's law?

What is the equation to find the potential energy stored in a spring?

What do we call a material that when stretched returns to its original shape?

What is the equation to find the force applied to a spring?

If a bungee rope has a spring constant of 5 N/m . How much must a person weigh in N if we want it to extend (stretch) 60 m ?

A spring compresses by 2 cm when a force of 50 N is applied. What is its spring constant?

What do we call a material that when stretched does not return to its original shape?

2.3 Forces in action

What is the equation for Gravitational potential energy?

A spring, which has a spring constant $k = 7.50 \text{ N/m}$, and has been stretched 0.40 m , what is the potential energy now stored in the spring?

What is the difference between Mass and Weight?

What is the gravitational field strength on Earth?

A spring with a spring constant $k = 800 \text{ N/m}$ has been stretched 70 cm . What is the potential energy now stored in the spring?

A 500 kg roller coaster carriage is pulled up to a height of 20 m . Calculate the weight on the 500 kg mass on Earth.

What energy does a 120 g clock have on a 1.3 m high shelf?

How much gravitational potential energy does the carriage gain?

What is acceleration due to gravity also known as?
